

BALUSTRADE & BALCONIES

What is a modular system?

Modular systems provide a huge range of modular components which are precision-manufactured off-site to an exacting standard, delivered to site and then assembled on-site. This means factory-controlled quality, faster installation, less mess, less waste and less energy consumption than products which are fabricated on-site. Spectrum's modular components are assembled with an internal connection system which requires no external fixtures and no welding for an ultra-smooth finish.

Why use Aluminium?

Aluminium is a great building material for many reasons: it provides maintenance-free durability and is also non-toxic, corrosive-free, non-combustible and 100% recyclable - a particularly useful feature for our Genesis industrial system designed for eco-friendly performance in the most harsh environments. The permanent finish of neaco's nylon powder coating - a standard specification on most Spectrum systems - provides smooth, clean lines for comfortable touch and high aesthetic value. It's also worth noting that our stainless steel systems provide many similar benefits.

Do neaco offer wood handrails?

We don't offer wood handrails but we do offer something even better with Timberline, a wood-effect aluminium system which gives you all the aesthetic virtues of wood without the environmental, hygienic and maintenance concerns associated with it.

To the naked eye Timberline's powder coated reproduction of natural oak grain is indistinguishable from the real thing. It gives you the traditional style of wooden handrails without the traditional problems!

Are the balconies supplied and installed or supplied only?

neaco can provide either - our Clearview balconies are designed for fast installation, particularly our Juliet balconies which are available in packs of standard sizes that are delivered with 3 weeks of ordering with all components ready to assemble (you can see these packs at our dedicated site at www.neacobalconies.co.uk). If you'd rather neaco took care of the installation, we can arrange for our team of fitters to carry out the work.

Is the structural glass suitable in high-traffic areas?

Clearline structural glass is very strong and suitable for high-traffic areas - the glass is toughened in accordance with BS EN12600 class 1. It is ideal for buildings likely to be used by children, where safety on staircases and landings is paramount - the system is very difficult for children to climb and there are no gaps through which they could pass.

Do neaco install the product as well as supply it?

Yes, we provide a full installation service in addition to technical support and consultation throughout the specification process. Our team of experts is always on hand to assist at every stage.

Do neaco offer bespoke solutions?

Yes, absolutely. Over the years we have worked with numerous architects and designers to incorporate bespoke features outside of our standard specifications, including light fittings to the top of stanchions, etched designs to glass infills and structural glass installed at unusual angles. We pride ourselves on the flexibility and adaptability of our technical support services, so please feel free to discuss your particular requirements with one of our team. Please see our page dedicated to bespoke solution for examples of our bespoke work.
